

SEC Agent Enterprise Data Package

SYSTEMS' Windows®-based control products are all capable of logging critical business data. SEC Agent is a small application installed on a plant computer, which runs in the background to implement data synchronization to a central server.

Enterprise Data Package.....

- Using an existing network connection, SEC Agent will duplicate program data to a central server
- Data is synchronized at user defined intervals
- Nearly an unlimited number of SEC Agents can be connected to a single, central server
- Sync takes place at the database level – not encumbering program operation
- Central server can be customer owned SQL Server (2000 thru 2010) or other options may be available at an additional fee
- No special SQL knowledge required – SEC Agent writes and activates the T-SQL commands
- Built-in server and data protection to minimize impact on network traffic
- Data on the central server matches the control program so tools, such as reports, can be shared
- Plant is not dependent on central server connection – if the connection is not functioning, the plant operates as usual and data is saved until the connection is available. (A non-intrusive message appears to inform the plant operator about lack of connection)

Products are sold subject to SYSTEMS Equipment's current Warranty, Terms, & Conditions.
